Did you download and use the APSS in tandem with your action plan?
Yes
If yes, was the APSS valuable?
Yes

Commitment Details

Commitment Update
In relation to what is reported in the literature, it has been decided to develop a sedation-analgesia protocol with less use of benzodiazepines, and when it is necessary deep sedation and prolonged use of electrical surveillance (Spectral Bis). Every intubated patient has surveillance of capnography (sometimes volumetric capnography), and this measure to ensure proper placement of the endotracheal tube, is followed by radiological studies that corroborate the correct placement of the tube, This year the action plan to reduce the risk of unplanned extubations includes: the implementation of difficult airway management alerts, as well as a checklist for monitorization of cases where cases of unplanned extubations occur.

Please describe any best practices your organization has learned through your commitment and share valuable lessons or challenges that were overcome.
- The use of evidence-based measures as a guide to developed safer processes.
- The importance of the continuous monitorization of the patients to reduce the risk of unplanned extubation.
- Engaging the hospital personnel in the different areas through organizational policies to improve the management of these patients
