Action Plan
Cedar Sinai’s Fall Bundle includes the fall risk assessment process, the use of visual cues and systems to alert staff to patients at high risk for falls while improving communication among staff regarding fall risk status, and individualized fall risk reduction plans. The Fall Bundle
addresses safe patient transfers while getting out of the bed for toileting or other needs, 
the use of equipment such as low beds, and improving staff and patient education. We are 
adding a Fall Prevention patient/family video to as a strategy for patient education. Along 
with the bundle, hourly rounding and safety checks are key to decreasing patient falls.

Commitment Update
The Fall Prevention patient/family video was rolled out for all patients/families to view upon 
Membership included, in addition to CS inpatient setting and staff, imaging, clinics, 
physician offices, our affiliate hospital and a preferred home health care provider). The task 
force developed recommendations for documentation and communication across levels of 
care, and clinical prevention services including) common risk assessment strategies, 
documentation of all falls with causal analyses, and injury prevention strategies across the 
continuum of care. The Falls Taskforce has undertaken two standardization efforts this year. 
First, a standardized electronic focus study approach for all falls with injury was developed 
using the patient’s electronic health record to gather details in the clinical context for all 
falls. This approach - creating an analyzable database - tracks and trends fall data for further 
informing preventative interventions.

Other
Challenge 14A - Falls and Fall Prevention in Adults

Please describe any best practices your organization has learned through your 
commitment and share valuable lessons or challenges that were overcome 
Cedars-Sinai strives for excellence in the prevention of falls. Over the past four (4) years, no 
patient at Cedars-Sinai has expired related to a fall with injury. Cedars-Sinai benchmarks its 
falls with injury data against large databases such as NDNQI and CALNOC. For example, 
from 2017-2018 the falls with injury on medical surgical units within the databases of NDNQI 
was 0.95 per 1000 patient days and for CALNOC 0.54 per 1000 patient days. However, at 
Cedars-Sinai, the rate of falls with injury is .19 per 1000 patient days. While we did not meet 
our aggressive pledged target of a 50% reduction (baseline 0.19/1000 patient days of falls 
with injury) to 0.085 falls with injury per 1000 patient days, we maintained our standard of 
excellence in prevention of falls with injury and have gained success in expanding our fall 
prevention program.
